

## CHAPTER VI

### CONCLUSION AND SUGGESTION

After analyzing the data and discussing the study relates to the problem statement, then the researcher presents the conclusion and suggestion.

#### A. Conclusion

Based on the result of the data analysis, it can be concluded in general that there is significant effect of using classical music to increase English achievement of the first year students of STM Ar-rahmah Kediri in the 2008/2009 academic year.

After knowing the result of pre test and post test of Experimental group, and the result shows that calculated-t = 12,75 while the t-table value on the degree of freedom 60 with significant level 0,005. It means that calculated-t 12,75 is higher than t-table 3,46. Therefore the alternative hypothesis, "There is a significant influence of using classical music in increasing students' English achievement of Experimental group" is accepted.

Then the researcher compares the result of post test in experimental group with the result of post test in control group, and the result is calculated-t = 6,54 while the t-table value on degree of freedom 62 with significant level 3,45. It means calculated-t 6,54 is higher than t-table 3,45. Thus the second alternative hypothesis, "There is significant difference between students' English

achievement in class that is taught using classical music with students' English achievement in class that is not taught using classical music in the learning process" is accepted.

The result above those students can improve or increase their achievement in English after they get treatment by using classical music in their learning process. Furthermore, the main aim of using classical music in class is to help the students ready to follow the learning process. Classical music is expected can make the students enjoy and fun to follow the learning process, so they can receive the information from the teacher well. Here, they just listen to classical music while they do the learning process.

## **B. Suggestion**

Based on the conclusion previously mentioned, some suggestions are put for the English teachers in STM Ar-rahmah and the teachers in general, the students and the readers who will be a next researcher.

### a) Suggestion for the English teacher in that school and the teachers in general

Teacher is the most influential figure toward the success of the teaching learning process. She/he should increase her/his own motivation and try to love her/his activity in the class.

After knowing the result of this research, it is suggested for all of the teachers especially the English teachers to try using classical music in the teaching learning process to increase students' achievement. It is used to make

the students enjoy the teaching learning process and can help the students in their information-intake process.

b) Suggestion for the students

It is suggested for the students to motivate themselves to be more enjoying the learning process with this way. It is also suggested that they should not have any feeling or fear and pleasure when they join in English class. They also can do this way when they are studying at home.

c) Suggestion for the other researcher

This research is just a small research. The researcher hopes that there are the other researchers who will study about the effects of classical music from another approach to add the proof about the positive effect of classical music.
